STUDENT ENROLLMENT & COURSE MANAGEMENT SYSTEM (SECMS)

1. Introduction

The Student Enrollment & Course Management System (SECMS) is a Salesforce-based application designed to manage student details, course information, instructor records, and enrollment activities. The main purpose of this project is to simplify academic administration and maintain student and course information in an organized manner.

In traditional systems, maintaining student records and managing course enrollment manually can be time-consuming and may lead to errors. SECMS provides a structured approach to storing and managing academic information using Salesforce custom objects, fields, and relationships.

2. Project Objectives

The main objectives of the Student Enrollment & Course Management System are:

- To maintain student information in a centralized system.
- To manage course details, including course name, category, duration, and fees.
- To store and organize instructor information.
- To simplify the process of enrolling students in courses.
- To establish relationships between students, courses, and enrollment records.
- To improve the accuracy and accessibility of academic information.
- To gain practical knowledge of Salesforce development and project documentation.

3. Scope of the Project

The scope of this project is to develop a basic student and course management application using the Salesforce platform. The system focuses on creating and managing student records, course details, instructor information, and enrollment data.

Administrators can maintain records in an organized manner and establish relationships between different objects. The project also demonstrates how Salesforce can be used to build applications with custom objects, fields, and lookup relationships.

4. Technologies and Tools Used

The following tools and platforms are used in this project:

Salesforce: Used to create custom objects, fields, relationships, and manage application data.

Skill Wallet: Used to access project requirements, follow implementation steps, and track project progress.

GitHub: Used to maintain project documentation, screenshots, and implementation details.

Google Drive: Used to store and share the project demonstration video.

5. System Modules

5.1 Student Management Module

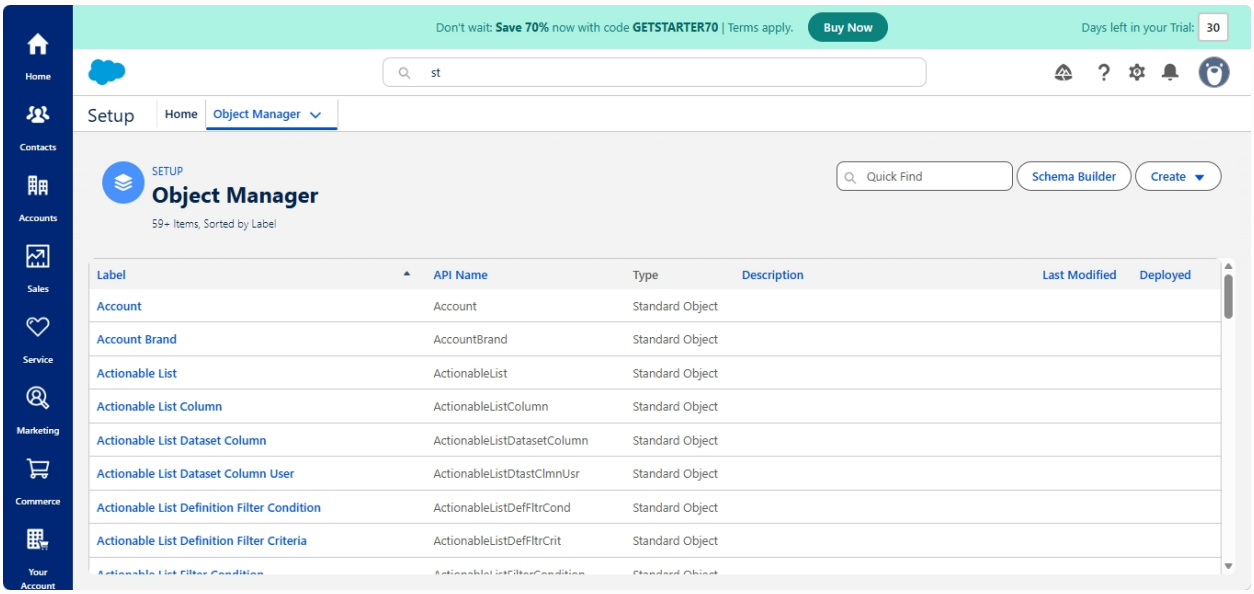

The Student Management Module stores and maintains student information. A custom Student object is created in Salesforce to record student details.

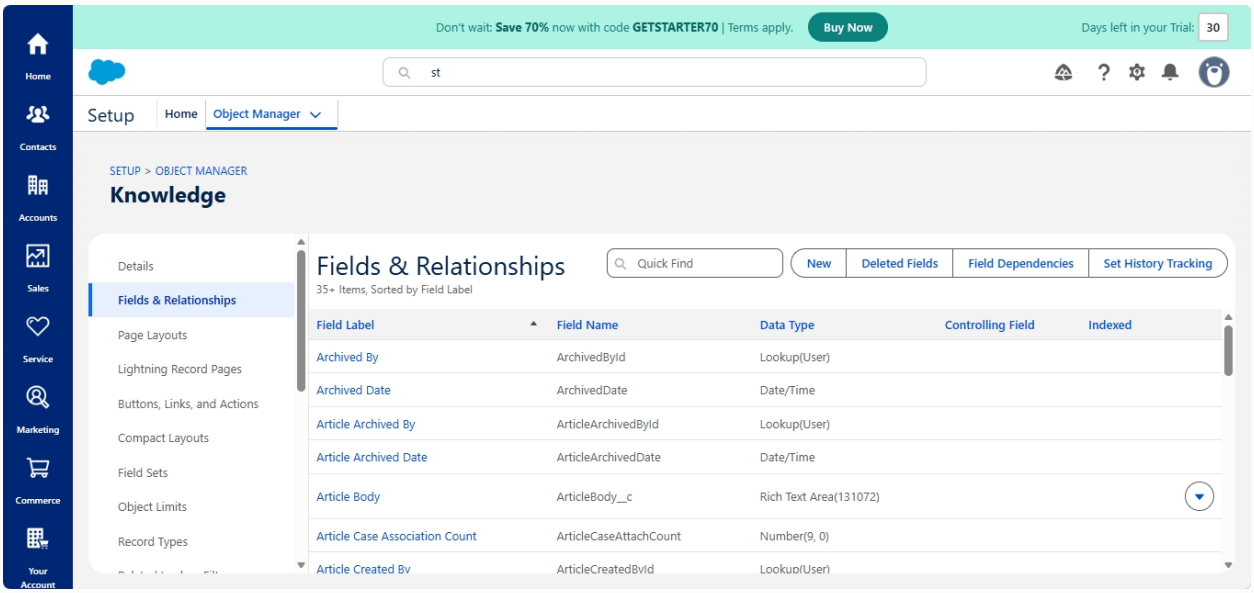

The fields may include:

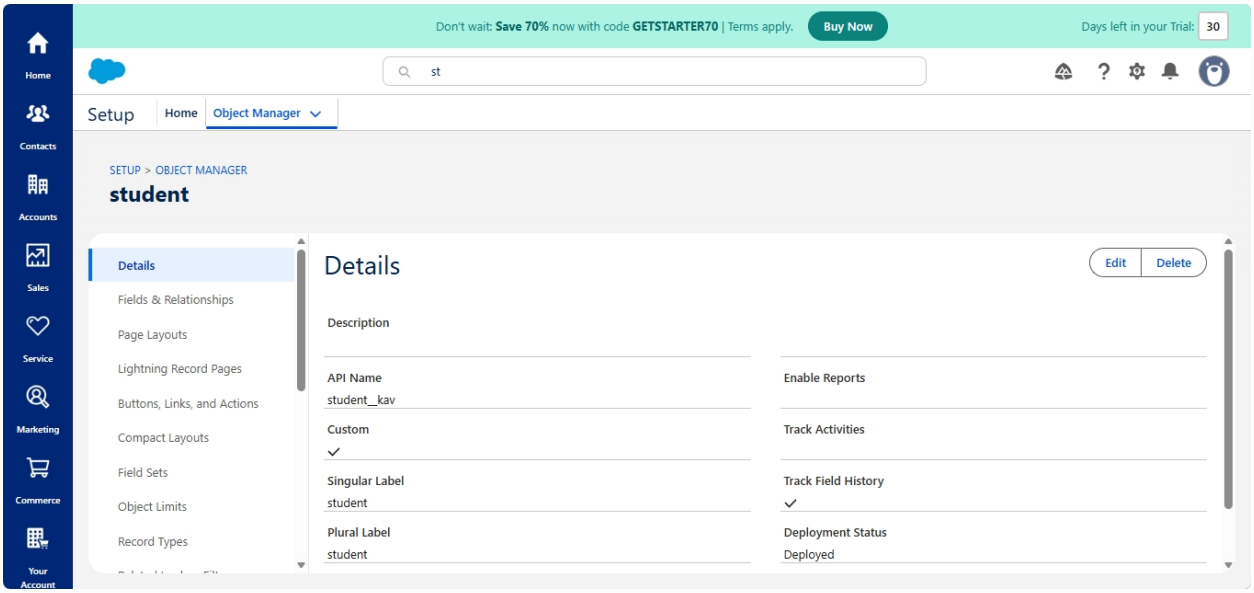

- Student Name
- Email Address
- Phone Number

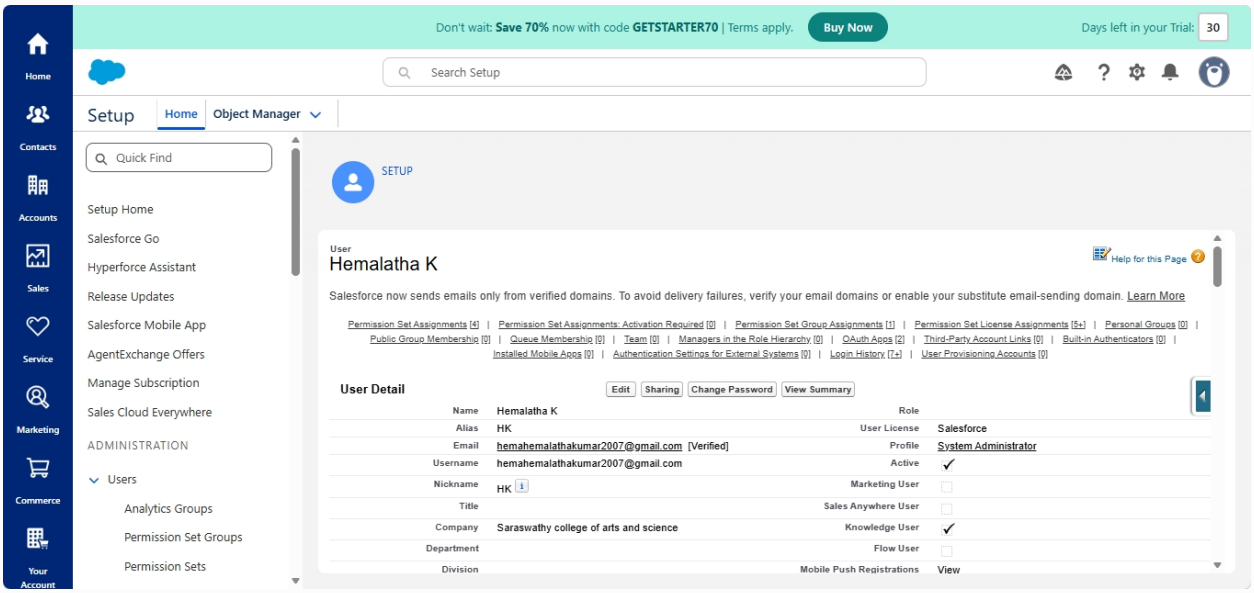

- Date of Birth
- Student Status
- Address

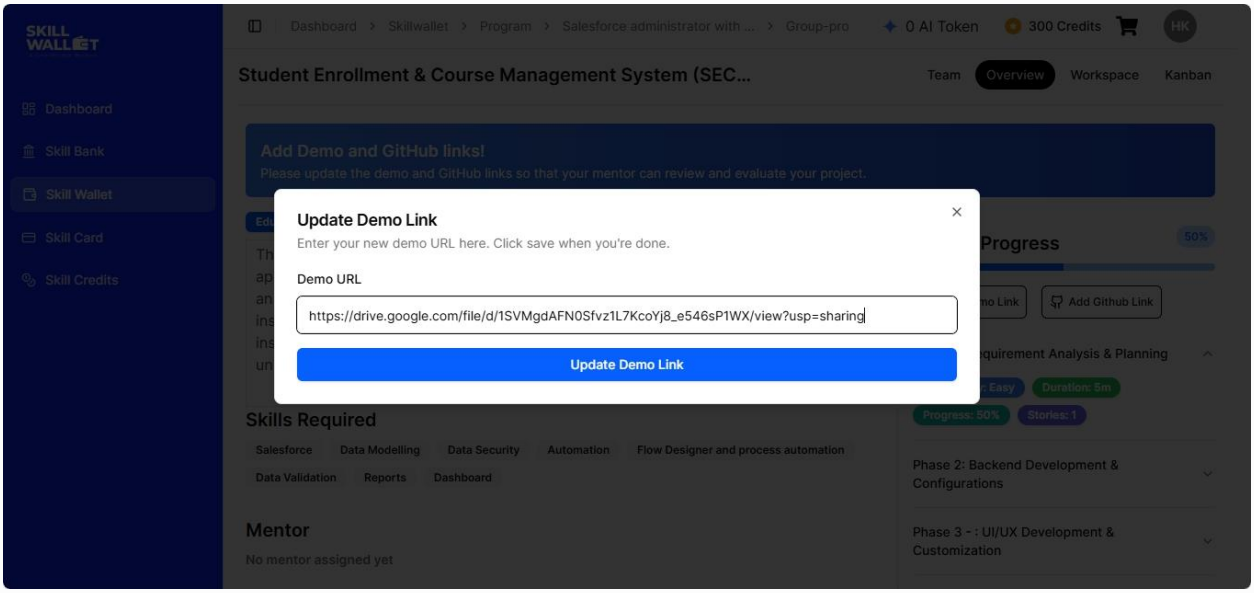

This module helps maintain student information in a structured format and makes records easier to access and update.

Phase 2: Backend Development & Configurations
Phase 3 - : UI/UX Development & Customization

5.2 Course Management Module

The Course Management Module manages information about the courses offered by an institution. A custom Course object is created to store course-related details.

The fields may include:

- Course Name
- Course Category
- Course Duration
- Course Fees
- Course Description

This module helps organize course information and provides a clear view of the available courses.

5.3 Instructor Management Module

The Instructor Management Module stores information about instructors who handle different courses. A custom Instructor object is created to maintain instructor records.

The information may include instructor name, email address, phone number, and other relevant details. This module helps organize instructor information for academic administration.

5.4 Enrollment Management Module

The Enrollment Management Module maintains information about students enrolling in courses. A custom Enrollment object is created to connect student records with enrollment details.

Lookup relationships are established between the relevant Salesforce objects to associate records. This structure helps administrators track student enrollment and maintain organized academic data.

6. System Implementation

The project is implemented using Salesforce custom objects and fields. First, the project requirements and user stories are reviewed to understand the system's functionality.

Next, the Student, Course, Instructor, and Enrollment objects are created. Appropriate fields are added to each object based on the project requirements. Lookup relationships are then configured to connect related records.

After creating the objects and relationships, the application is tested by entering sample data and checking whether the records are stored and linked correctly. Screenshots are captured to document the implementation process.

7. Project Documentation and Submission

Project documentation is an important part of the implementation process. The development steps, object configurations, field details, relationships, and screenshots are organized as evidence of the completed work.

A demonstration video of approximately 5–10 minutes is prepared to explain the project, its modules, and the implementation process. The video is uploaded to Google Drive, and the sharing link is added to the project submission.

The project documentation and screenshots are uploaded to a GitHub repository. The repository link and demonstration video link are submitted through Skill Wallet. Finally, the project tasks are updated for faculty review.

8. Advantages of the System

The Student Enrollment & Course Management System offers several advantages:

- **Organized Data:** Student, course, and instructor records are maintained systematically.
- **Easy Access:** Records can be accessed and updated through Salesforce.
- **Improved Accuracy:** A structured data model helps reduce errors caused by manual record maintenance.
- **Efficient Enrollment:** Student enrollment information can be managed in a dedicated module.
- **Better Data Relationships:** Salesforce relationships connect related student and enrollment records.
- **Easy Documentation:** GitHub and Google Drive help organize and share project evidence.

9. Future Enhancements

The system can be enhanced in the future by adding more advanced features, such as automated enrollment notifications, course capacity tracking, student performance management, attendance tracking, and reports and dashboards.

Additional Salesforce automation tools can also be used to reduce repetitive administrative tasks and improve the overall user experience.

10. Conclusion

The Student Enrollment & Course Management System is a useful project for understanding how Salesforce can support academic administration. It demonstrates the creation of custom objects, fields, and relationships for managing student, course, instructor, and enrollment information.

Through this project, practical knowledge of Salesforce configuration, data organization, project implementation, and documentation can be developed. Overall, SECMS provides a structured foundation for managing academic records and can be extended with additional features to meet future institutional requirements.
